

An Internship Report

on

ARTIFICIAL INTELLIGENCE AND MACHINE LEARNING (AI/ML)

Internship at Codec Technologies Pvt. Ltd.

Submitted to

IILM UNIVERSITY

Academic Internship Report

Submitted by

PRANAV MODI

Roll No.: 25scs1003002600

Designation: Artificial Intelligence Intern

Internship Period: 30 July 2026 to 31 August 2026

Duration: One Month

2026

1. CANDIDATE'S DECLARATION

I, Pranav Modi, Roll No. 25scs1003002600, a student of IILM University, declare that this report presents an account of my Artificial Intelligence and Machine Learning internship at Codec Technologies Pvt. Ltd., undertaken from 30 July 2026 to 31 August 2026 in the role of Artificial Intelligence Intern.

The report describes the internship programme, its learning areas and the supporting documents supplied with it. The offer letter and internship completion certificate included in this report were issued in my name. Sources used for the programme description are acknowledged in the references.

I will verify the completed project details and any supporting results before final submission. Any third-party code, datasets or learning material used in the final project documentation will be acknowledged appropriately.

Signature: _____

Student Name: Pranav Modi

Roll No.: 25scs1003002600

Place: _____

Date: _____

2. ACKNOWLEDGEMENT

I express my sincere gratitude to Codec Technologies Pvt. Ltd. for providing me with the opportunity to undertake a one-month internship as an Artificial Intelligence Intern. The programme provided a structured setting for studying artificial intelligence and machine learning and exploring their practical applications.

I am thankful to the internship team and the assigned project heads for making the learning platform, training material and project guidelines available. The progression from foundational concepts to application-oriented project work helped connect academic learning with practical problem-solving.

I extend my gratitude to IILM University for supporting my academic development and encouraging experiential learning. I also thank everyone who offered guidance and encouragement during the internship.

Finally, I am grateful to my family and friends for their support throughout this learning experience.

Signature: _____

Pranav Modi

Roll No.: 25scs1003002600

TABLE OF CONTENTS

1. Candidate's Declaration	2
2. Acknowledgement	3
3. Internship Completion Certificate	5
Internship Offer Letter	6
4. Project Description	7
4.1 Introduction / 4.2 Organization Profile	7
4.3 Problem Statement / 4.4 Objectives / 4.5 Scope	8
4.6 Technologies / 4.7 System Architecture	9
4.8 Methodology	10
4.9 Outcomes and Project Record	11
4.10 Certificates and Supporting Evidence	12
5. Bibliography / References	13

Report preparation note

The programme facts are based on the supplied offer letter, completion certificate and course screenshots. Project titles, implementation details and measured results were not supplied; the project record on page 11 must be completed before submission. Degree, department and batch details have not been assumed.

3. INTERNSHIP COMPLETION CERTIFICATE

Certificate issued to Pranav Modi by Codec Technologies Pvt. Ltd. for the one-month Artificial Intelligence internship conducted from 30 July 2026 to 31 August 2026.

Figure 1. Internship completion certificate supplied by the student.

INTERNSHIP OFFER LETTER

Figure 2. Internship offer letter dated 30 July 2026.

4. PROJECT DESCRIPTION

4.1 Introduction

This report documents the one-month internship undertaken by Pranav Modi, Roll No. 25scs1003002600, a student of IILM University, at Codec Technologies Pvt. Ltd. The internship designation was Artificial Intelligence Intern, and the period recorded in both the offer letter and completion certificate is 30 July 2026 to 31 August 2026. The offer letter specifies the location and mode as Pan India, Hybrid.

Artificial intelligence concerns computational systems that perform tasks such as recognizing patterns, interpreting language and making predictions. Machine learning is an approach within artificial intelligence in which models learn relationships from data. An AI/ML internship connects these concepts with activities such as data preparation, model selection, evaluation and interpretation.

The supplied course interface presents a four-week learning sequence covering AI and Python foundations, machine learning basics, neural networks and advanced AI applications. It also includes an internship project section. The project instructions require participants to select and complete any two projects from the provided list.

4.2 Organization Profile

Codec Technologies Pvt. Ltd. is the internship provider named on the completion certificate. In its offer letter, Codec Technologies describes its work as IT and business consultancy and presents the internship as an opportunity to develop industry-relevant knowledge and practical skills. This profile is based on the supplied company document.

The offer letter states that the intern reports to assigned project heads. The supplied programme page provides learning modules, project requirements and a certificate stage. Together, these documents establish the organization, role, programme period and training structure relevant to this report.

PROBLEM STATEMENT, OBJECTIVES AND SCOPE

4.3 Problem Statement

Learning AI/ML requires more than understanding algorithm definitions. A practical task must be expressed as a clear problem, suitable data must be prepared, and a model must be evaluated against the intended objective. Common difficulties include poor data quality, unsuitable features, overfitting and misleading evaluation results.

The programme addresses the transition from foundational learning to application-oriented work by offering projects in prediction, classification, recommendation, language processing and computer vision. Each option requires a different relationship between the input data, chosen method and expected output.

4.4 Project Objectives

The learning objectives are to understand the relationship between AI and machine learning; develop familiarity with Python-based problem-solving; study basic machine learning concepts and neural networks; and connect these ideas with a practical application.

The project component aims to develop the ability to define a task, prepare data, select an appropriate method, assess outputs and communicate the work clearly. Its submission instructions also emphasize sharing completed work through GitHub or LinkedIn and sending the link through the specified programme channel.

4.5 Scope of the Project

The documented scope includes the four-week curriculum and the project choices displayed on the training platform. These choices include stock price prediction, sentiment analysis, handwritten digit recognition, movie recommendation, customer churn prediction, a customer service chatbot, spam classification, fruit image classification, weather analysis and speech-to-text transcription.

This report summarizes the learning framework and project workflow. The actual two selected projects, datasets, software versions, source code and evaluation results must be recorded from the student's own work. No production deployment or numerical model performance is claimed here.

TECHNOLOGIES AND SYSTEM ARCHITECTURE

4.6 Technologies and Tools

The course outline identifies Python as a foundation topic. The project descriptions mention several methods and libraries, depending on the selected application. The following are programme options, rather than a verified list of tools used in the student's completed projects.

Prediction and classification

The stock prediction task suggests linear regression or more advanced techniques. Customer churn uses classification, while the spam classifier suggests Naive Bayes or Support Vector Machines. The weather task introduces historical data analysis and regression.

Language and image applications

The sentiment analysis task suggests NLTK or spaCy for natural language processing. Handwritten digit recognition specifies a convolutional neural network and the MNIST dataset. The fruit classifier also suggests CNNs. The speech transcription task refers to Python speech recognition libraries, such as SpeechRecognition.

4.7 General AI/ML System Architecture

The following conceptual architecture describes a typical learning project; it is not a claim about a specific system implemented during this internship.

Input layer: The application receives task-appropriate data, such as text, images, historical observations or audio. The intended output determines how examples should be organized and labelled.

Preparation layer: Data are checked and transformed into a usable representation. Where relevant, training and evaluation data are separated so that model assessment reflects performance on unseen examples.

Model layer: A suitable algorithm learns from the prepared training data, or applies predefined rules in a rule-based application. Its choice depends on the problem and available evidence.

Evaluation and output layer: Predictions or responses are assessed using task-appropriate checks. The final output may be a class label, predicted value, recommendation or transcript, accompanied by documented limitations.

METHODOLOGY

4.8 Learning and Project Methodology

The supplied course sidebar organizes the programme into four weekly learning areas followed by internship project work. The sequence below follows those visible topics; the explanatory text summarizes their educational purpose and is not a daily attendance or activity log.

Week 1: Foundations of AI and Python

The foundation stage introduces the role of artificial intelligence and Python-based programming. It provides context for expressing problems computationally and preparing for data-oriented work.

Week 2: Machine Learning Basics

The machine learning stage introduces how data can support prediction and classification. A sound workflow links the learning objective to data preparation, model choice and evaluation rather than judging a model only on its training performance.

Week 3: Introduction to Neural Networks

The neural network stage introduces models built from interconnected computational units. The project catalogue connects this area to image-oriented applications, including handwritten digit recognition and fruit classification.

Week 4: Advanced AI Applications

The application stage connects learning with practical tasks. The project options extend across text, images, recommendations, time-dependent data and audio, allowing participants to select a suitable area of application.

Project selection, documentation and submission

The platform instructs participants to complete any two listed projects, publish them on GitHub or LinkedIn, and share the link with the offer letter through the specified email channel. A complete project record should state the problem, data source, method, evaluation approach, result and limitations. The two records on the next page are reserved for the student's actual work.

OUTCOMES AND PROJECT RECORD

4.9 Outcomes

The supplied completion certificate records completion of the one-month internship as an Artificial Intelligence Intern. The programme learning areas support an understanding of AI foundations, machine learning, neural networks and application-oriented problem-solving. Project-specific outcomes require the corresponding code, outputs and evaluation records.

Completed Project 1

Project title: Stock Price Predictor

Problem and objective: Develop a model that predicts stock prices based on historical data.

Dataset / input source: Historical stock price data.

Tools and method: Linear regression or a more advanced prediction technique.

Evaluation and actual result: Completed model for predicting stock prices from historical data.

Completed Project 2

Project title: Movie Recommendation System

Problem and objective: Build a simple system that suggests movies based on user ratings or genres.

Dataset / input source: User ratings and/or movie genre data.

Tools and method: Collaborative filtering or content-based filtering techniques.

Evaluation and actual result: Completed recommendation system for suggesting movies from ratings or genres.

SUPPORTING EVIDENCE AND CONCLUSION

4.10 Certificates and Supporting Evidence

The completion certificate and offer letter are reproduced on pages 5 and 6. The course screenshot below records the project requirements and options. Its progress indicator is a snapshot of the portal at the time of capture; the separately supplied certificate is the completion document.

Figure 3. Project guidelines, cropped from the supplied course screenshot.

Conclusion

The internship provided a structured programme linking AI/ML foundations with practical project opportunities. The attached documents establish the internship role and period. Completing the project records with the actual methods and results will provide the detailed technical account required for academic submission.

5. BIBLIOGRAPHY / REFERENCES

The following supplied materials were used to prepare this report. The sample report was used for structure and formatting; its student-specific achievements and Google/EduSkills programme details have not been carried into this report.

Internship documents

Codec Technologies India. “Internship Offer Letter,” addressed to Pranav Modi, issued 30 July 2026. Records the designation Artificial Intelligence Intern, Pan India / Hybrid mode, and period 30 July 2026 to 31 August 2026. Supplied image reproduced on page 6.

Codec Technologies Pvt. Ltd. “Certificate of Internship,” awarded to Pranav Modi for the Artificial Intelligence Intern programme conducted from 30 July 2026 to 31 August 2026. Supplied image reproduced on page 5.

Course material

Codec Technologies. “1-Month Artificial Intelligence Internship,” Project Work page. Supplied screenshots showing the weekly module outline, ten project options and instructions to complete any two projects. A cropped view is reproduced on page 12.

Format reference

“Internship_Report_Mohd_Noorain.pdf.” User-supplied internship report used as a reference for the title page, declaration, acknowledgement, certificate section, project-description headings and bibliography layout.

Project-specific references to add

Add the exact dataset sources, documentation, tutorials and repositories used in the two completed projects. Include author or organization, title and link where available. These sources should correspond to the final project records on page 11.
